The Performance Trials reported in this book are coordinated by Dr. D.E. Falk and Dr. L.A. Hunt, Department of Plant Agriculture, Crop Science Division, OAC, University of Guelph under the mandate of the OMAFRA Cereals Projects. Glen Meatherall and Zorka Szlavnics conduct the data analysis, prepare and distribute the Progress Reports which are the basis for information in OMAFRA Publication 296.

INTRODUCTION

The Performance Trials of spring barley, oats, spring wheat and winter wheat are conducted by the Ontario Cereal Crop Committee in cooperation with the members of the Ontario Soil and Crop Improvement Association, commercial plant breeders, CAT Colleges and Agriculture Canada. Certified seed of registered cultivars was generously provided by Advantage Seeds, C & M Seeds, First Line Seeds, W.G. Thompson & Sons Ltd., SeCan, Ferguson Seeds, and Pioneer Hybrid International.

SPRING CEREALS

For spring cereals, Area I is no longer used because of the general low performance relative to other crops, and the low acreage. Areas II and IV have been combined into a single Area, Area III remains separate, and Areas V and VI have been combined into one unit. This gives three major areas for spring cereals, Southwestern Ontario, Eastern Ontario, and Northern Ontario. Each is a major climatic zone with a significant acreage of spring cereals.

Spring Barley. Barley planting and harvest were generally early and quality was good. Mildew was very light in most areas, with some rust reported. Some cereal leaf beetle affected a few sites. Yields were generally average or below.

Oats. Oats were generally affected a little more by the low rainfall than barley. Some areas had moderate crown rust; very little BYDV was reported. Yields of most varieties were generally average. Quality of the grain was generally good with little weathering due to dry harvesting conditions.

Spring Wheat. Yield data were obtained from seven locations in 1999, three from Area II, three from Area III and one from Area V. The overall average yield for Area II was 3.77 t/ha, for Area III it was 3.89 t/ha and in Area V, New Liskeard, the only location growing the trial, reported an average yield of 4.96 t/ha.

Spring Durum Wheat. There were no durum wheats tested in the Ontario Performance Trial this past year. Data for the 1999 durum wheat Western Registration Trial grown at the Elora Research Station are presented in this report.

WINTER CEREALS

Winter Barley. Winter barley generally came through the winter in excellent condition with little disease during the growing season. Yields were generally good, with harvest much earlier than normal.

Fall Wheat. There were thirty-one entries planted at ten locations across the Province, during the 1998-99 growing season. Of these entries thirteen were soft white, eight were soft red, eight were hard red and one was a hard white. Due to severe spring erosion of the trial site at Kemptville only nine out of the ten trials planted reported data. The overall average yield in Area I was 5.96 t/ha, in Area II it was 5.75 t/ha and the overall provincial average was 5.70 t/ha. The only Area III location reporting data was Ottawa where the average yield was 4.70 t/ha.

GROWING CONDITIONS

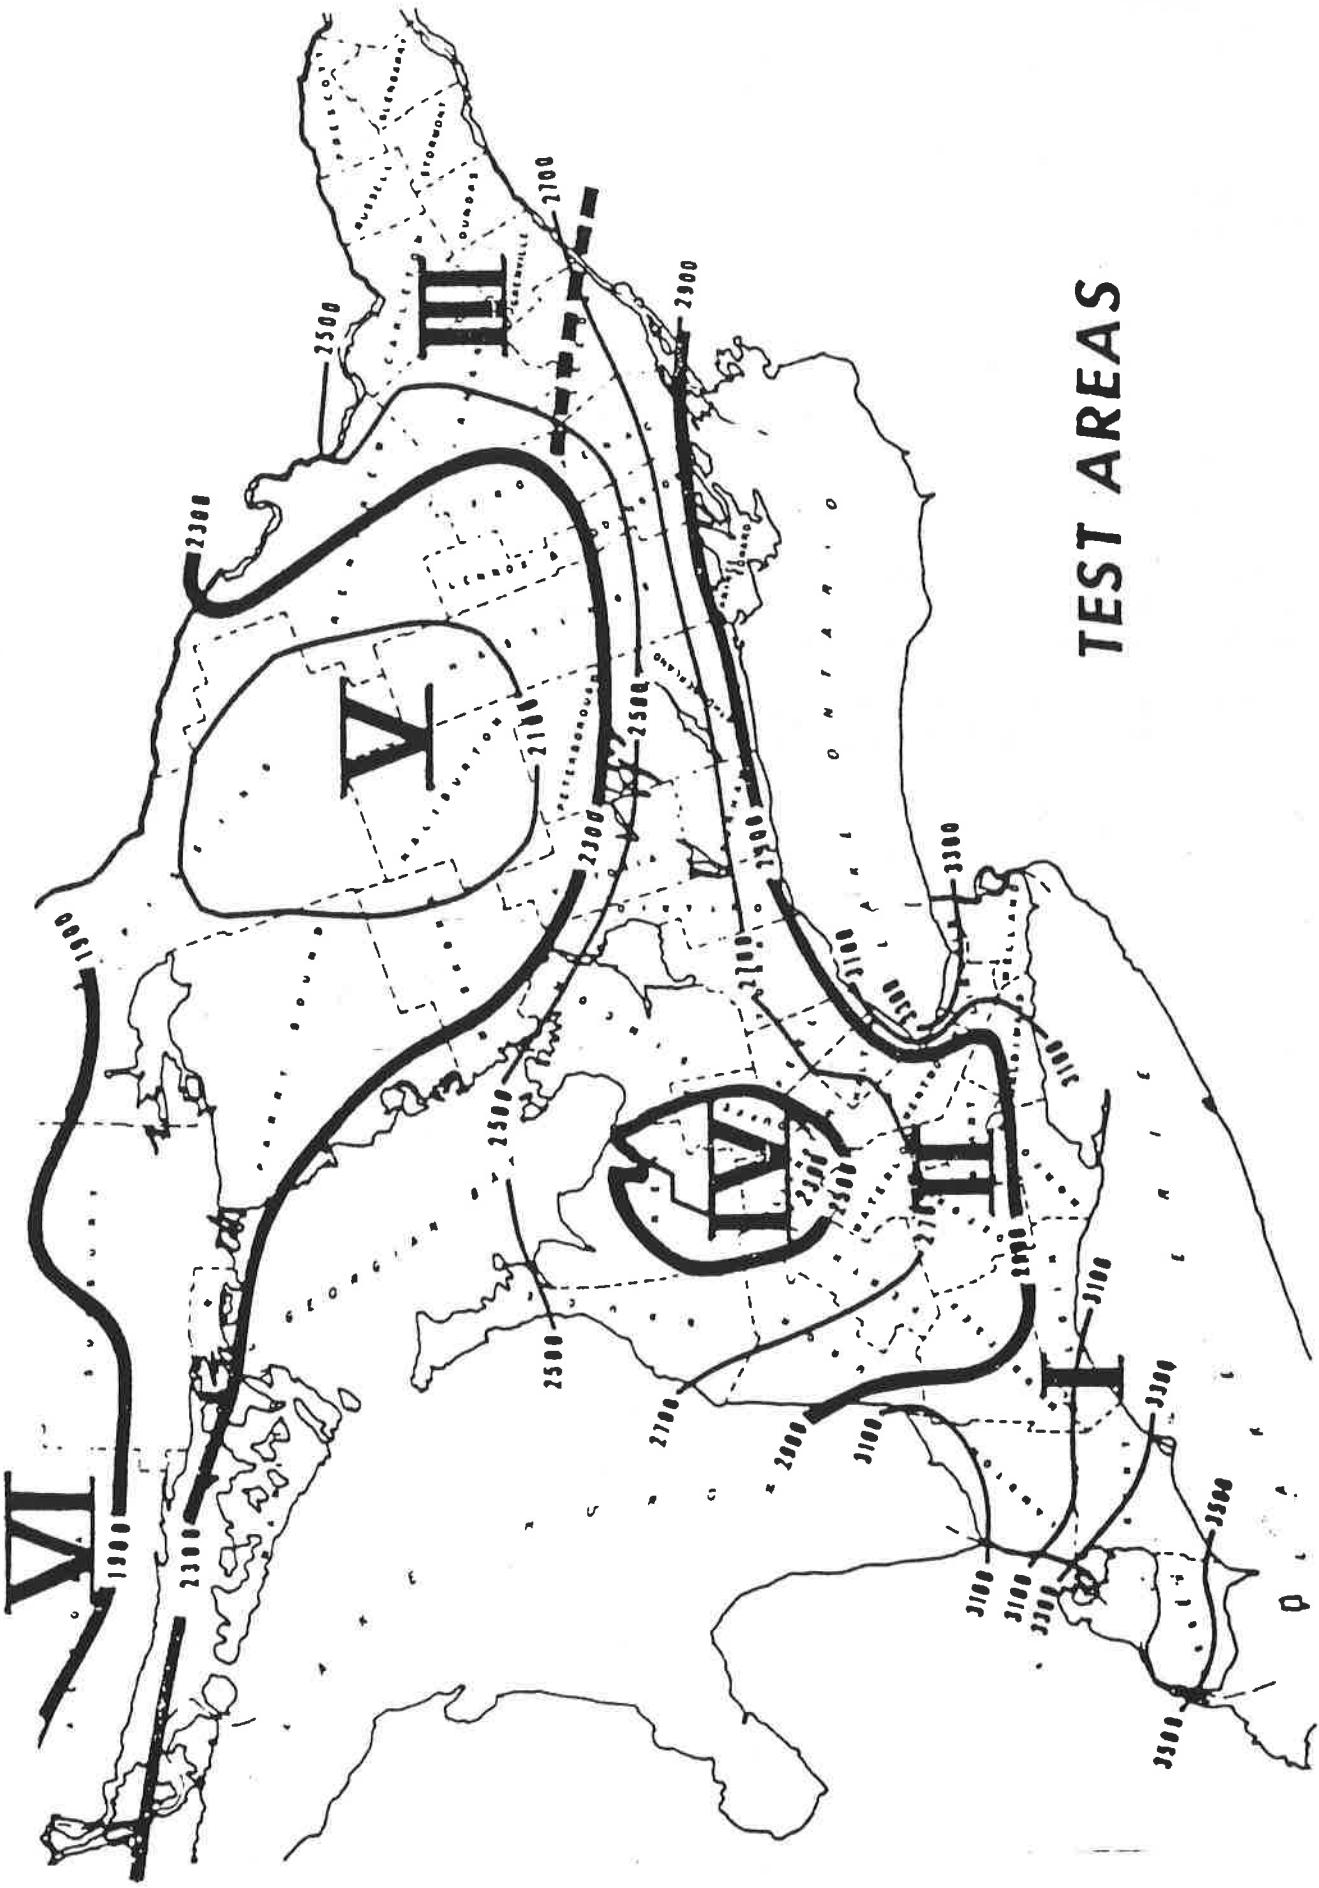

Spring came early to most of Ontario with planting beginning well ahead of normal in most areas. It was warm and relatively dry through most of the summer in most of the province. Everything was early; planting, heading, harvest. Thunderstorms provided most of the moisture throughout the growing season. Timing of rain was more significant than amounts as some good yields were reported even though most of Area II & IV were well below average.

The testing areas for the Performance Testing program in Ontario are outlined by using the enclosed heat unit map as a guide.

| | Winter | Spring | |
|-----------|---------------|---------------|---|
| Test Area | I | | - Southwest of the 2900 heat unit lines |
| Test Area | II | II & IV | - West of Frontenac, between the 2900 and 2300 heat unit lines and the Dundalk plain (Grey, Dufferin and Wellington) within the 2500 heat unit lines. |
| Test Area | III | III | - East of Frontenac, between the 2900 and 2300 heat unit lines. |
| Test Area | V | V & VI | - Northern Ontario below the 2300 heat unit lines. |

The results of the 1999 tests and the average performance of cultivars over the past several years are published in this report. The long term averages of Performance Trials are reported to assist farmers in making variety selection decisions.
